GERMAN WELDING SOCIETY

Technical Bulletin DVS 2918

Electrical design of resistance welding equipment

Welding circuit – Transformer – Power unit

Technical Comittee of the DVS
Working Group V 3 "Resistance Welding"
Subgroup V 3.6 "Measuring and process control"

This publication has been drawn up by a group of experienced specialists working in an honorary capacity and its consideration is recommended. The user should always check to what extent the contents are applicable to his particular case and whether the version on hand is still valid. No liability can be accepted by the DVS − Deutscher Verband für Schweißen und verwandte Verfahren e.V., and those participating in the drawing up of the document.

Orders to: DVS Media GmbH, P. O. Box 10 19 65, 40010 Düsseldorf Germany, Phone +49 (0)211/1591-0, Telefax +49 (0)211/1591-150

Content

1 Aim of the Technical Bulletin
2 Terms and symbols
3 Block diagram for single-phase and three-phase resistance welding equipment
4 Basic information on the design of resistance welding equipment
4.1 Design according to the welding assignment
4.2 Design based on the welding assignment, taking into account the component reserve
4.3 Design according to the technical data of resistance welding equipment
5 Calculation of the duty cycle
6 Calculating the equivalent secondary continuous current
7 Calculation of the primary current of the welding transformer and mains current
8 Determination of the effective resistances in the welding circuit
8.1 Determination of the effective resistance at the welding spot
8.2 Effective resistance of power supply lines
8.3 Mechanical load of the power supply lines
8.4 Earthing for the welding circuit
9 Characteristic features in the electrical design of AC-WSE
9.1 Apparent resistance of the welding circuit
9.1.1 Calculation of the reactive resistance of power supply lines
9.1.2 Calculation of the apparent resistance and short-circuit resistance of the welding
9.2 AC welding transformer
9.2.1 Types of AC welding transformers
9.2.1.1 AC integrated transformers
9.2.1.2 AC suspended transformers
9.2.1.3 Transformers with flange connection
9.2.1.4 Transformers for robotic and manual gun applications
9.2.2 Calculation of the required open-circuit voltage and continuous current
9.2.2.1 Transformer selection by the transformer manufacturer
9.2.2.2 Transformer selection through calculation
9.2.2.3 Transformer selection with an output diagram
9.3 Selecting the thyristor power unit of the control
9.4 Reactive power and $cos\varphi$
10 Characteristic features in the electrical design of MFDC-WSE
10.1 MFDC welding transformer
10.1.1 Types of MFDC welding transformers
10.1.2 Calculation of the effective resistance and short-circuit resistance of the welding circuit
10.1.3 Selection of the transformer series according to welding current level, weld time and duty cycle
10.1.3.1 Load on the transformer winding
10.1.3.2 Load on the rectifier diodes
10.1.4 Selection of the required open-circuit voltage in the output diagram
10.2 Selection of the inverter power unit
11 Layout of the protection and isolating equipment
11.1 Layout of the protection and isolating equipment with AC-WSE
11.2 Layout of the protection and isolating equipment with MFDC-WSE
